

> Cleaning Machines

Rosemor International Ltd. has launched a new escalator and moving-walk cleaning service. The company's **Rotomac ET15B** now contains 15 rotating brushes of four different lengths and materials to scrub and sweep dirt into the machine and off escalator steps. A new illuminated stainless-steel control panel is built to sustain substantial usage and common misuse. The machine is still mains operated, but a new built-in battery allows for its safe removal from the steps in an emergency. Customers can purchase a complete system together or separately.

New attachments for the Rotomac are also available: the **T10** has been developed to plug into it and run as the escalator or moving walk is moving for a quick clean of the horizontal part of the step. The **T10i** was developed for customers who did not want to clean escalators and only needed a horizontal-tread cleaning solution or for those (such as airport maintainers) who service a high number of moving walks. It incorporates the T10 on a trolley-based system.
